

# 2006-10-19 Requirementworkshop Breakout COMO

looking at (vehicle) data

is there an overview of

required data?

available data?

table for data model input is presented

missing information?

safety things?

[need for methodology that other data can be added](#)

Origin-Destination Information

to what extent OD is treated and how?

[to be decided what belongs to a "CVIS service"](#)

[what should be a CVIS product to be offered here?](#)

only 'temporary databases' or to which extent are also historical information needed?

[here: no indication that it is needed](#)

[prepare that a service can be set up later which treats with this](#)

quality / trustability of data?

COMO needs to check plausibility / verify data at fusion

FOAM needs to prevent fakes, hackings and manipulations (-> integrity, confidentiality)

[check requirements if this is well enough reflected.](#)

AOB

SSI (Standard Sensor Interface)

an option for vehicle data interface

used in CVIS?

could be a specific API connection to FOAM

## general issues

clarifications of questions, how the system is set to work

plug in your application in FOAM and you are connected to everything

what is COMO data about

organisational architecture scenarios

[do scenarios](#)

who should run which CVIS technical entities?

testside

[to be "bought in"](#)

Vehicle ID / Identification

different / contradicting needs

anonymously for COMO

"temper proof" vehicle identification for some others

If we distinguish ID methods on Application method

is there a risk of duplication of efforts?

[Requirement: provide "open access" to security / Identification mechanisms?](#)

Vehicle identification: liase with standardisation

consider

TC 204

standard is in elaboration

VIN

EVI project

## FOAM

managing the system

1

does FOAM have requirements about system management

system administration

diagnosability

failure management

2

priority / ressource management

can have different applications' request different priorities (e.g local hazard

warning)

AIDE can have input (Erwin Vermassen, ERTICO)

also priorities in the network and communication, triggered by applications

needs?

-> COMM

## plenum

who is operating a COMO?

project is ambitious

build on on what's going on now

watch out for the size! many stake holders!

Paul: we need a stakeholder organisation?

like VII coalition in US

how could CVIS be sold in future?

you won't see technology

you will see services

mobile client is extending the computer?

CVIS is the nutra sweet

CVIS is the TETRA Pack

we also need to sell it to stake holders!

e.g. network operators?

! beware that CVIS does not have the same fate as 3G technology currently

who is the CVIS customer?

not the end user

identify!

beware: implementation vision seems a complex scenario!

can we provide a simple one?

elaborate a prioritisation on most important parts of CVIS
